SUMMARY

Software Engineer (1+ YOE) with production experience building **Java**, **Spring Boot**, microservices and **REST APIs**, including redesigning a data-sync pipeline into a parallel **Spring Batch** architecture that resolved a recurring production incident. Builds side projects exploring distributed-systems concepts — rate limiting and event-driven fraud detection — using Redis, Kafka, and Docker. Experienced with **CI/CD (Jenkins, SonarQube)** and testing (JUnit, Mockito) in Agile teams.

EXPERIENCE

Software Engineer | Verizon

July 2025 – Present

- Resolved a critical production incident by replacing a legacy sequential Java scheduler with a distributed, parallel **Spring Batch pipeline** (~25K records across two internal systems) using connection pooling — eliminating recurring pipeline failures at scale.
- Optimized REST API performance by **resolving N+1 query issues** (@EntityGraph), adding composite indexes, and introducing caching (@Cacheable) and pagination — improving response time by ~20%.
- Automated import of 10K+ cabinet and equipment templates by building a Python (Streamlit) tool using fuzzy-matching logic, the Claude API, and industry-standard normalization — eliminating manual data entry.
- Shipped code reliably across environments in an Agile workflow using **CI/CD** pipelines (**Jenkins, SonarQube**) and **GitLab**, Git-based version control.
- Increased backend code coverage by writing unit and integration tests with **JUnit** and **Mockito**, and validated APIs with Postman.

Graduate Engineer Trainee | Verizon

January 2025 – June 2025

- Built and integrated backend platform services with Spring Boot REST APIs, reducing **system errors** by **25%**.
- Delivered full-stack features by integrating responsive React.js UI components with backend REST APIs, ensuring seamless frontend-backend communication.
- Debugged full-stack issues across frontend, backend, and database layers to improve system stability.

PROJECTS

Distributed Rate Limiter | Java, Spring Boot, Redis, Docker

[GitHub ↗](#)

- Enforces per-tenant API request quotas consistently across multiple app instances, preventing abuse without blocking legitimate traffic, using a distributed token-bucket algorithm backed by a single atomic **Redis Lua script** (EVALSHA)
- Deployed across a 3-instance Dockerized topology behind nginx, sustaining **~1,000 requests/sec at p95 10ms** with no failed requests observed during Gatling load testing.

FraudGuard | Kafka, Spring Boot, Python, Redis, PostgreSQL

[GitHub ↗](#)

- Built a real-time fraud detection pipeline using **Kafka**, Spring Boot, Redis, FastAPI, and PostgreSQL to score and store high-risk payment transactions.
- Added a circuit breaker (Resilience4j) so scoring outages don't stall the consumer, and a read-only **MCP server** so an LLM can query fraud data in plain English without writing SQL.

SKILLS

Languages: Java, Python, C++

Frameworks: Spring Boot (Spring Data JPA, Spring Batch), React.js, FastAPI

Distributed Systems: Kafka, Redis, Docker

APIs & Backend: RESTful API design, Microservices architecture

Database: PostgreSQL, MongoDB

CS Fundamentals: Data Structures & Algorithms, System Design Fundamentals, OOP, DBMS, Operating Systems, Computer Networks

EDUCATION

Mody University of Science and Technology

September 2021 – May 2025

B.Tech, Computer Science Engineering | CGPA: 8.75

ACHIEVEMENTS

- Published research paper on Autonomous Drone Navigation System in ICASEM 2024.
- Published research paper on Blockchain in Voting Systems in JAD 2023.
- Solved 450+ Data Structures & Algorithms problems across competitive coding platforms.
